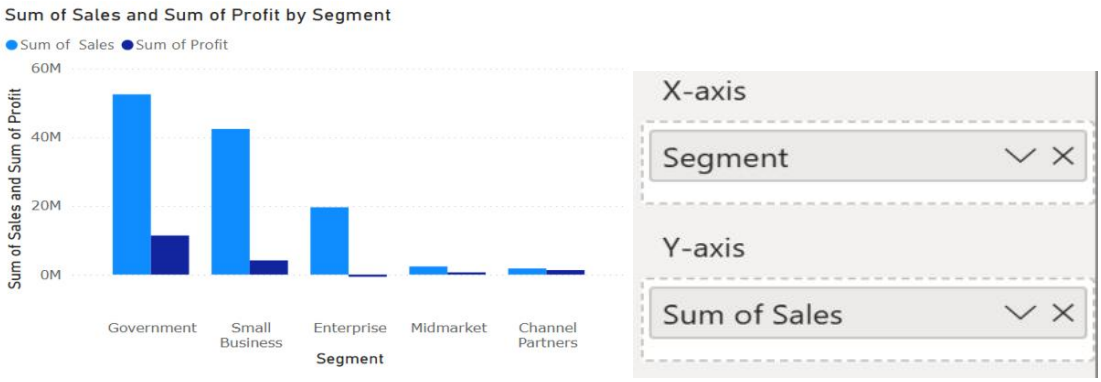
Workshop Week 9

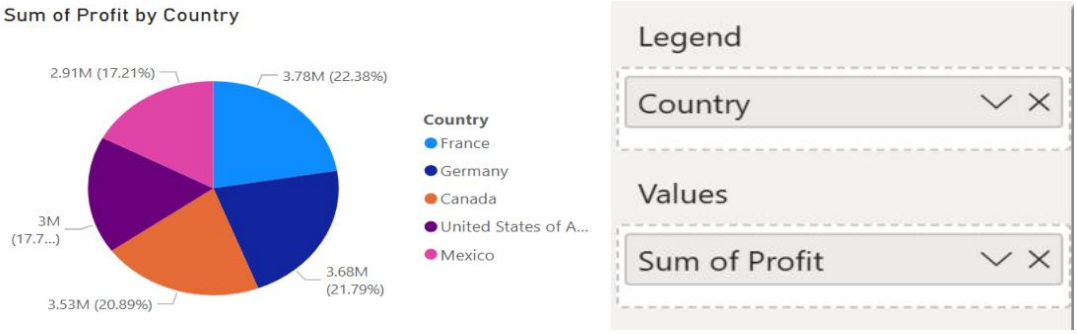
Questions:

1. **How does profit vary with sales across different segments?**



In the bar chart, Government and Small Business are the top two segments with the highest sales, reaching around 50M and 43M respectively. However, their profits are significantly lower in comparison. Enterprise sits in the middle with moderate sales of about 20M and very little profit. Midmarket and Channel Partners both show low sales and minimal profit. Overall, while sales vary widely across segments, profit remains relatively small across all of them.

2. **Build pie-chart showing which country generates the highest profit?**

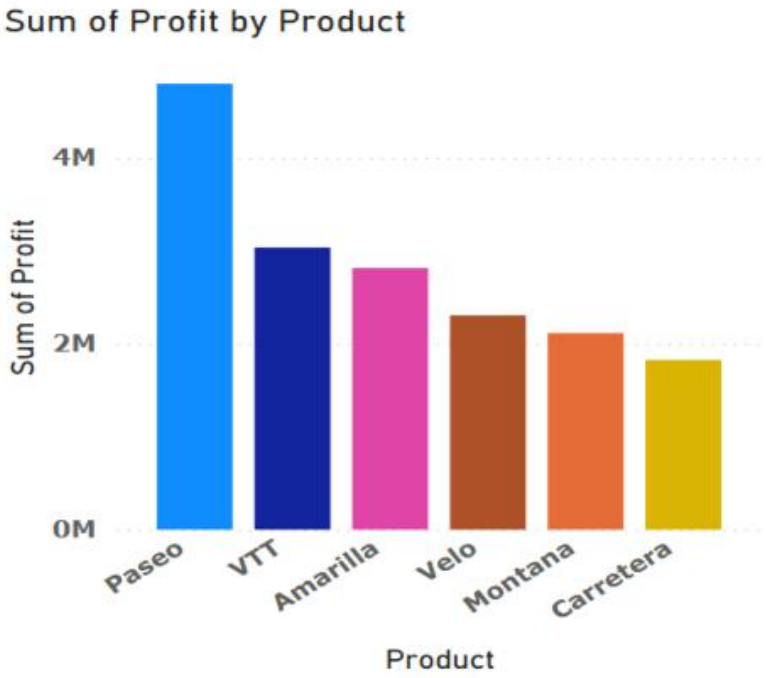


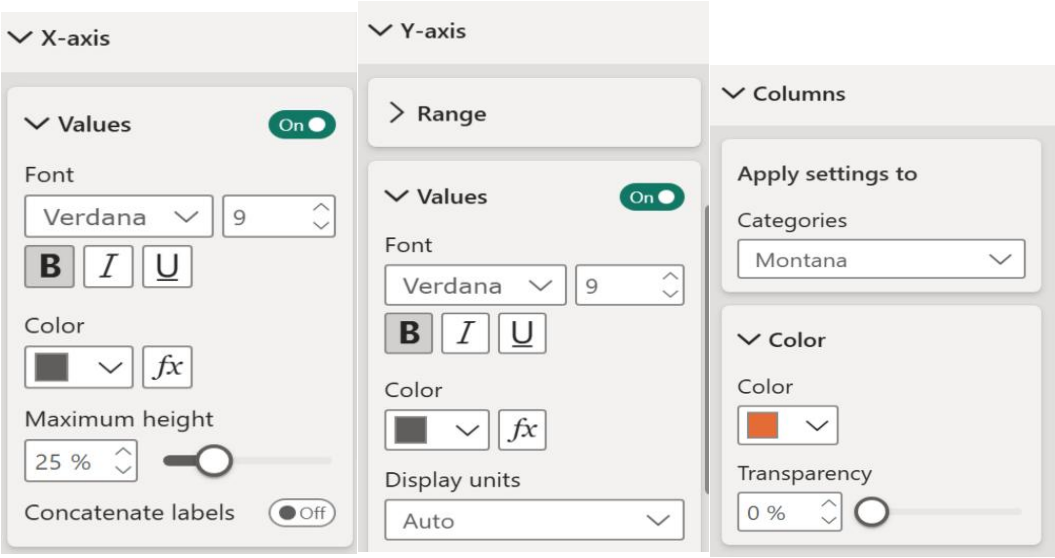
In the pie chart, France generates the highest profit at 3.78M, which accounts for 22.38% of the total. Canada comes in second with 3.68M at 21.79%, followed closely by United States with 3.53M at 20.89%. Mexico contributes 3M at around 17.7%, while Germany has the smallest share at 2.91M, making up 17.21% of the total profit. Overall, the profits are fairly evenly distributed across all five countries, with France leading by a slight margin.

3. Which product category is most profitable?

Chart: Bar Chart

Font: Verdana Bold



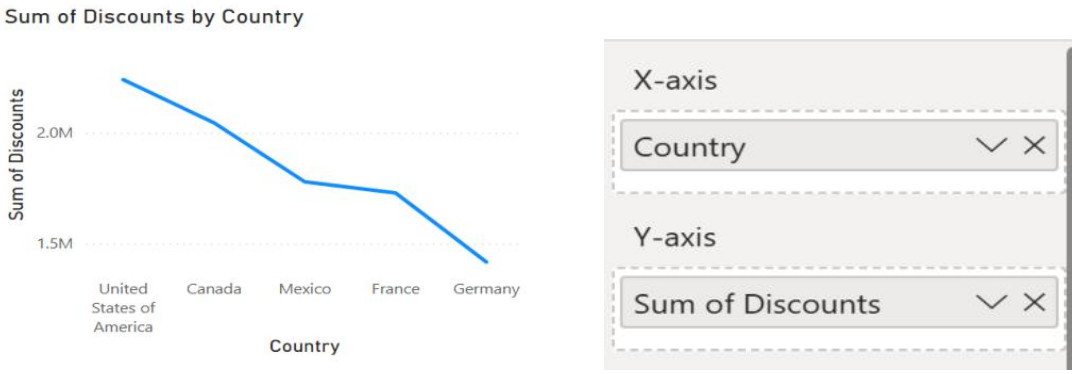


In the bar chart, Paseo is clearly the most profitable product, with a profit of just above 4M, standing well above all other products. VTT comes in second at around 3M, followed closely by Amarilla at roughly 2.8M. Velo and Montana are fairly similar, both sitting at approximately 2M. Carretera is the least profitable among the six products, coming in just under 2M. Overall, Paseo leads by a significant margin, while the remaining five products are relatively close to each other in profitability.

The chart is formatted using Verdana font at size 9 for both the X-axis and Y-axis values, with bold styling applied and label colors set to black. The X-axis has a maximum label height of 25% and concatenate labels is turned off. The Y-axis display units are set to Auto. For the columns, the color settings are applied specifically for each category.

4. How does discount affect profit over country? Show using two separate line chart and provide insight.

In this line chart, France starts with the highest profit at just above 3.5M, followed by Germany which shows a slight drop. The line then continues to decline through Canada, United States of America, and finally Mexico, which records the lowest profit at around 2.9M. Overall, the trend shows a steady decrease in profit as we move across the countries.



In this line chart, United States of America has the highest total discounts at just above 2M, followed by Canada which shows a noticeable drop. The line continues to fall through Mexico and France, with Germany recording the lowest discounts at around 1.5M.

Insights:

Comparing both charts, the United States of America gives the most discounts but also shows low profit, which suggests that heavy discounting is negatively affecting profitability. France, on the other hand, receives fewer discounts and maintains a higher profit. This indicates that countries with lower discounts tend to generate better profits, showing a clear negative relationship between discounts and profit.

5. Display total profit, average sales, and total discount using card visuals, with a blue background and white font color.

Three card visuals are displayed, each with a blue background and white font color.

This card shows a Total Profit of 16.89M, giving a quick summary of the overall profit generated across all records.

Now, this card shows Average Sales of 169.61K, representing the average sales value per transaction or record in the dataset.

Again, this card shows Total Discounts of 9.21M, indicating the overall amount of discounts that were given out across all sales.
